

Bob builds. Mycrosaift breaks. Software gets better.

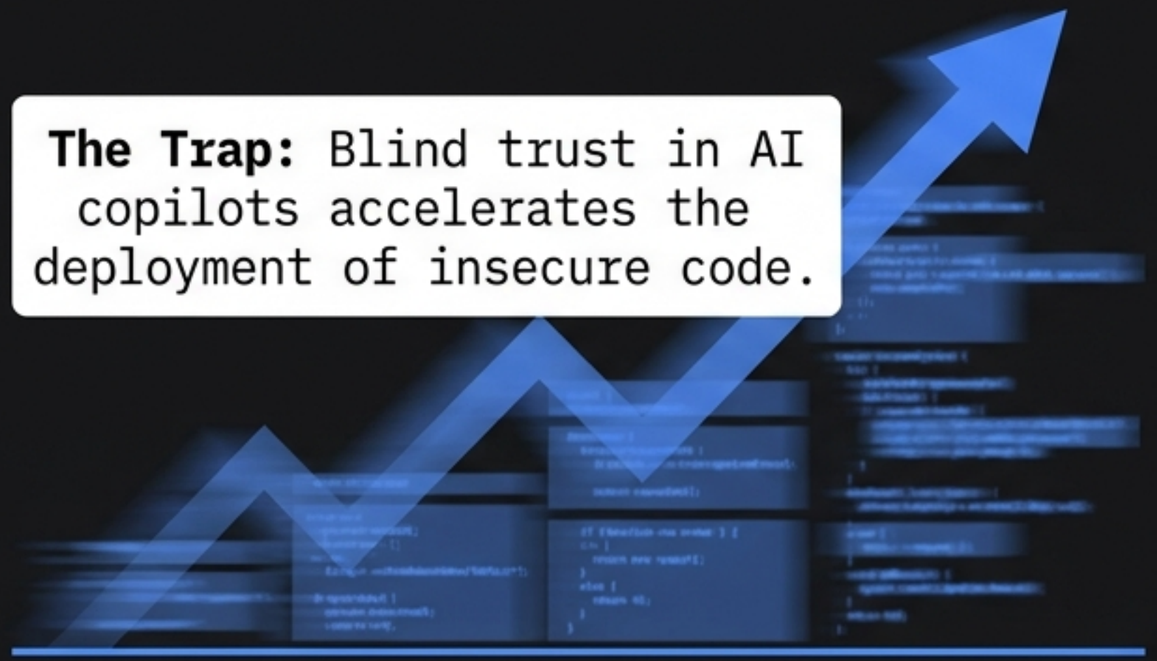

An AI Software Engineering Arena built for the IBM Bob 2.0 Hackathon.

> SYSTEM_READY. INITIALIZE_MATCH_

Gemini Notebook

"AI makes shipping code fast. It also makes shipping vulnerabilities fast."

Builder agent (Bob)

The Trap: Blind trust in AI copilots accelerates the deployment of insecure code.

Breaker agent (Mycrosaft)

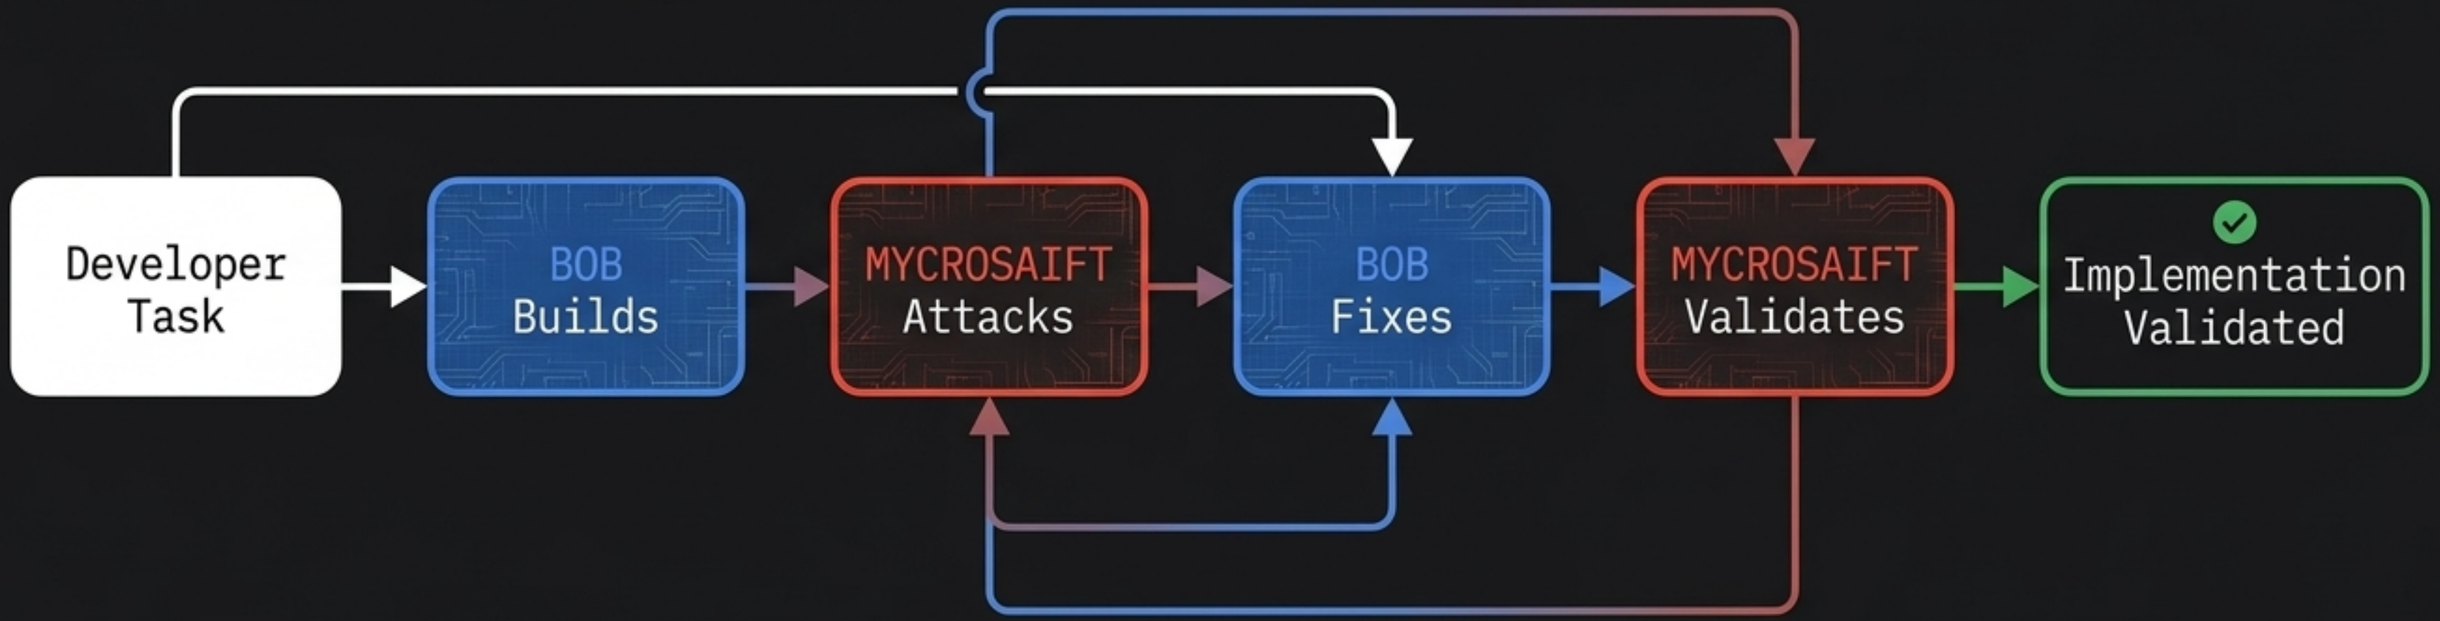

The Bottleneck: Human security review cannot keep pace with AI generation speeds.

The Blindspot: Traditional Static Application Security Testing (SAST) misses complex logical flaws like token reuse or MIME spoofing.

Gemini Notebook

To secure AI-generated code, you need an AI-generated adversary.

By pitting a **Builder Agent** against an **Adversarial Breaker Agent**, we create a self-healing, continuous security loop. No guessed vulnerabilities–only proven exploits and verified patches.

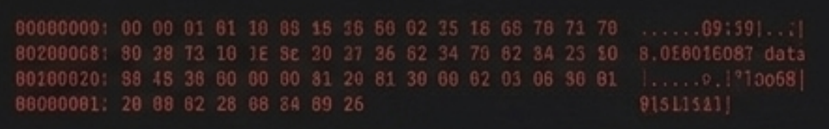

Gemini Notebook

The Arena in Action: Deterministic Validation

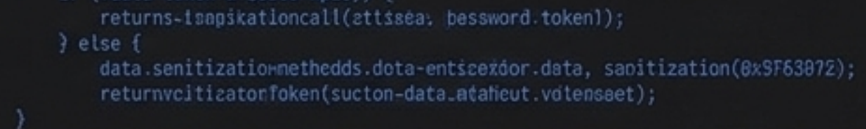

Vulnerability Ledger

Password Reset Scenario - 3 Rounds

CRITICAL: Token reuse after successful password reset.

[Sanitized token-invalidation logic applied]

Vulnerability Ledger

File Upload API Scenario - 2 Rounds

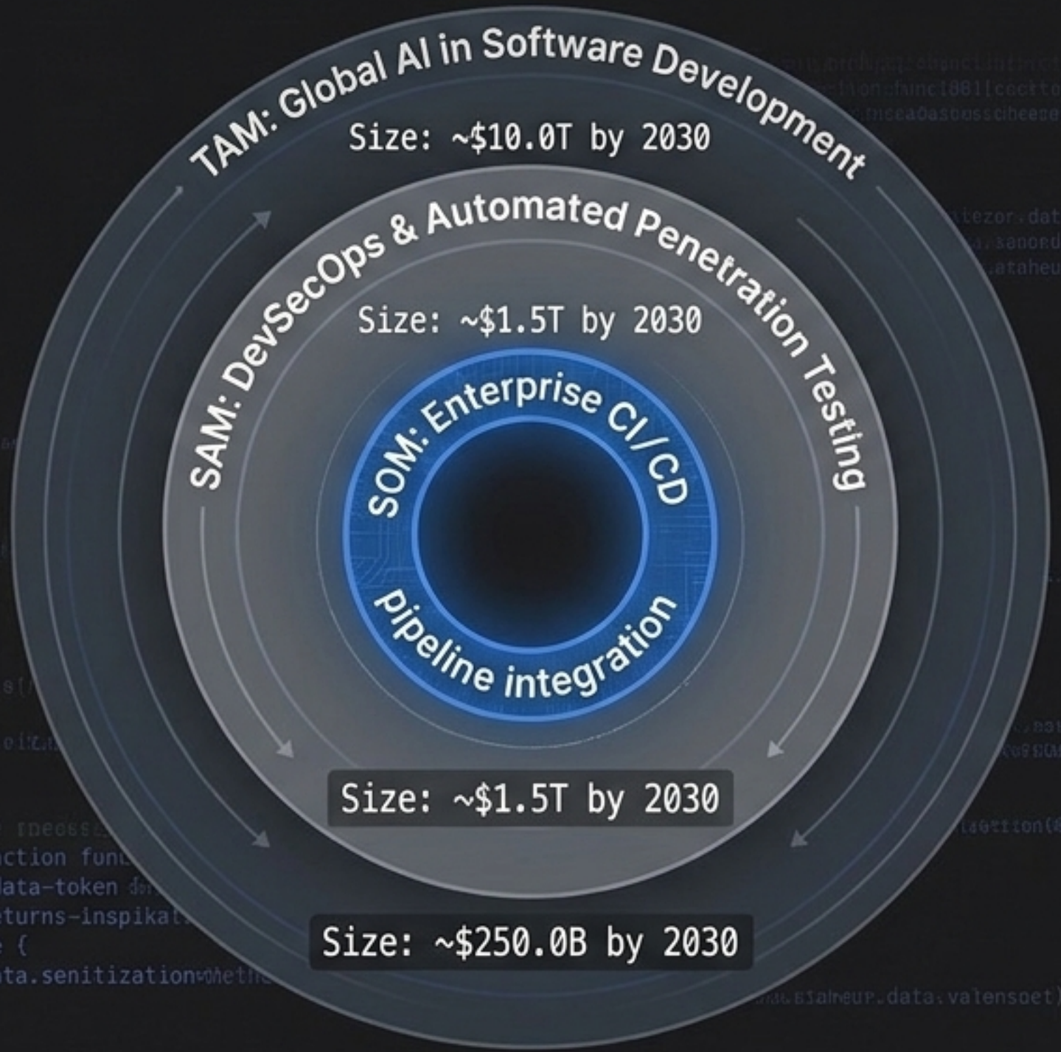

CRITICAL: Path traversal via unsanitized original filename.

[MIME type validation and path sanitization applied]

Mycrosaift doesn't just flag issues—it generates reproduction tests to prove them.
Bob doesn't just write code—it patches proven vulnerabilities.

Gemini Notebook

A Scaling Market for Autonomous Security Validation

The market is shifting from assisted coding to agentic software engineering. Security must shift from a post-development human bottleneck to an in-pipeline adversarial necessity.

This shift creates an immediate, massive opportunity for autonomous validation platforms integrated directly into the CI/CD fabric.

Gemini Notebook

The DevSecOps Paradigm Shift

	Autonomous Exploitation	Autonomous Remediation	Speed of Iteration	Contextual Awareness
Human Red-Teaming	✓	✗	✗	✓
Standard SAST / SonarQube	✗	✗	✓	✗
Standard AI Copilots	✗	✓	✓	✗
Bob vs Mycrosaift				

Gemini Notebook

B2B Enterprise SaaS: Pricing by Validation, Not by Seat

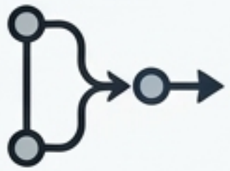

Developer Edge

Localhost integration mapping (port 3000)

Pricing based on isolated Agentic Rounds.

Team Pipeline

GitHub/GitLab CI/CD plugin

Priced per Arena Compute Hour during PR reviews.

Enterprise Arena

Fully integrated watsonx.ai self-hosted LLM deployment

High-volume autonomous validation.

Shifting away from per-seat licensing to a consumption-based Arena Compute Hours model seamlessly integrated into existing CI/CD pipelines.

Gemini Notebook

Exponential ROI: The Economics of Autonomous Mitigation

The compute cost of running an adversarial agent loop scales perfectly and predictably. The cost of a human security engineer reviewing a PR—or missing a vulnerability—is exponential.

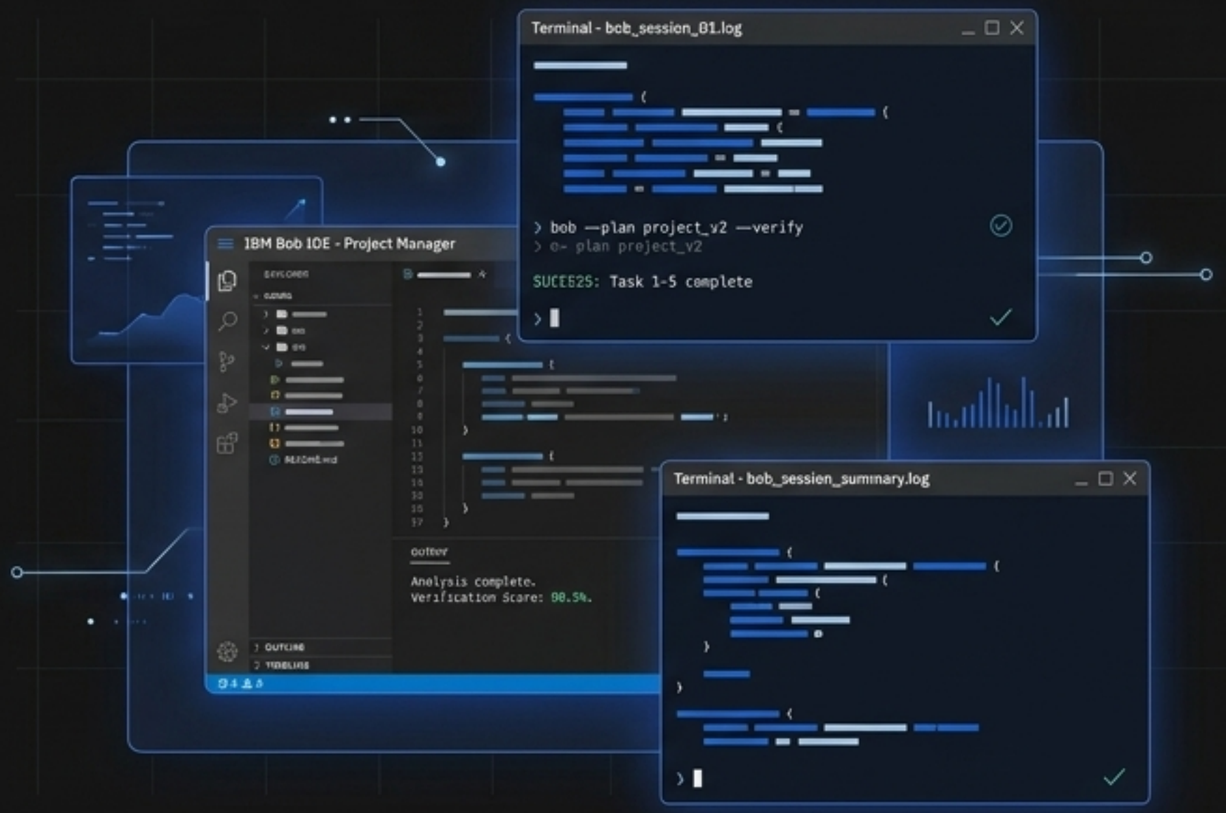

Gemini Notebook

The Architect & The Tools

Wincarf

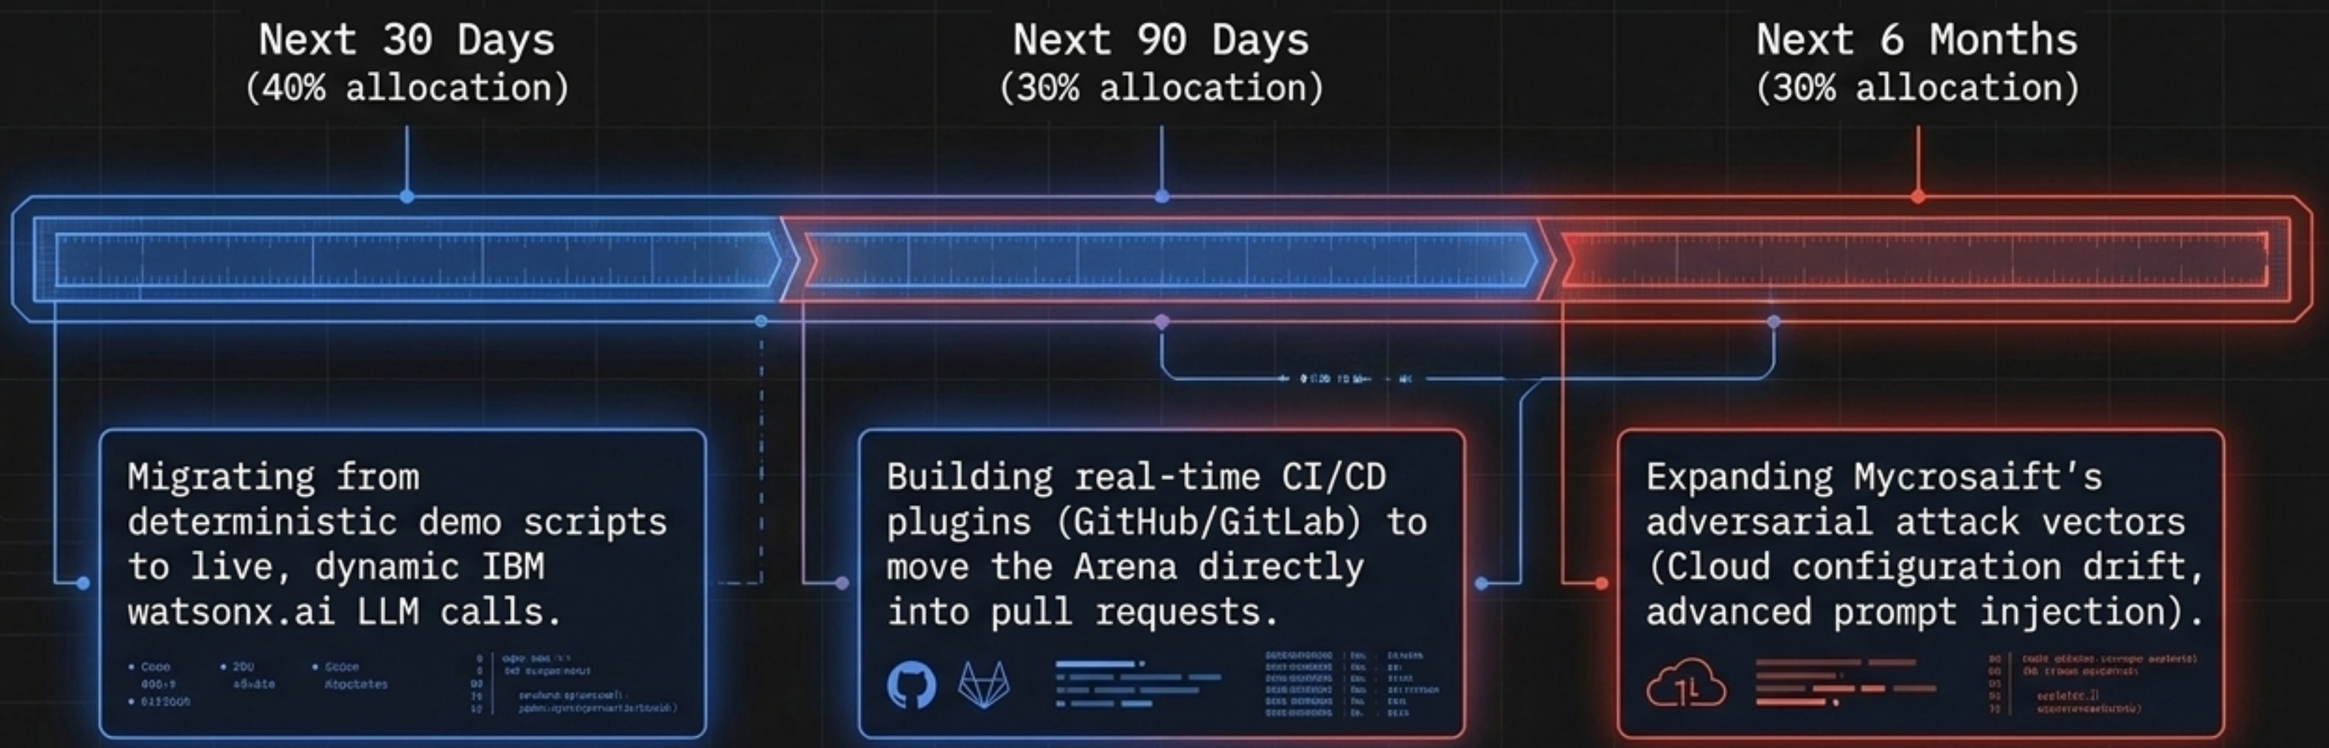

Creator & Lead Engineer

Built with purpose using IBM Bob 2.0. Verified task session summaries (bob_sessions) confirm end-to-end utilization of the IBM Bob IDE for project planning and implementation.

Gemini Notebook

Beyond the Hackathon: The Roadmap

The $5,000 hackathon prize funds the critical bridge from a deterministic MVP to a live, watsonx.ai-powered DevSecOps pipeline tool.

Gemini Notebook

Stop guessing if your AI code is secure. Prove it in the Arena.

`github.com/Wincarf/bob-vs-mycrosaift`

`npm run dev -> localhost:3000`

Created by Wincarf for the IBM Bob 2.0 Hackathon.
